

GIT_REMEDIATION_LOG

NetworkPeer Git Remediation Log

Root cause analysis and fixes applied — September 6, 2026

Issues Found & Fixed

Issue 1: `addy9087/Networkpeer` — Remote-side index-pack failure

Symptom: `git push` to `https://github.com/addy9087/Networkpeer.git` failed with:

```
remote: fatal: did not receive expected object
1e8894d9d6aa1fa33056f6fc03e0b42f0818256b
error: remote unpack failed: index-pack failed
```

Root Cause: The push from `rudraaxl/NetworkPeer` contained commits that `addy9087/Networkpeer` didn't have in its history. When GitHub tried to index the received pack, it couldn't find a parent object (`1e8894d`) because the two repos had diverged histories.

Fix Applied: 1. Cloned fresh from `addy9087/Networkpeer` (which has the correct local history) 2. Created `feature/platform-overhaul-vipul-sync` branch 3. Copied all changed files into the fresh clone 4. Committed with the same changes 5. Pushed with `--no-thin` and increased `http.postBuffer` :

```
bash git config http.postBuffer 524288000 git push -u origin
feature/platform-overhaul-vipul-sync --no-thin
```

Result: ✅ Push succeeded - Branch: `feature/platform-overhaul-vipul-sync` - Commit: `1f45ac6` - PR URL: <https://github.com/addy9087/Networkpeer/pull/new/feature/platform-overhaul-vipul-sync>

Issue 2: Local git repository corruption

Symptom: All git operations (`log` , `status` , `add` , `show`) hung or failed with:

```
fatal: bad object refs/heads/integration/fork-sync
fatal: bad object refs/codex/turn-diffs/checkpoints/...
Unknown: ChildProcess.kill
error: short read while indexing .gitignore
```

Root Cause: Multiple issues: 1. **Corrupted pack file:**

`.git/objects/pack/pack-8caeb72e3b03bfc8591ac66717aa99756d118312.pack`
— `git verify-pack` reported `SIGBUS` (signal 10), indicating the pack file was corrupted on disk 2. **Stale refs from other tools:** `refs/codex/turn-diffs/` (from Codex agent), `refs/heads/integration/fork-sync` with empty content, `refs/heads/integration/fork-sync 2` (space in filename) 3.

Corrupted HEAD file: HEAD was pointing to `refs/heads/integration/fork-sync` instead of `refs/heads/main` 4. **Empty `refs/heads/main`** : The main branch ref file was 0 bytes 5. **Corrupted `.git/info/exclude`** : Binary content instead of text

Fix Applied: 1. Removed stale refs: `refs/codex/` , `refs/heads/integration/`
2. Restored HEAD to `ref: refs/heads/main` 3. Restored `refs/heads/main` to known commit `36191801988eaaa300163efb462a8aadf0d2400e` 4. Fixed `.git/info/exclude` with proper text content 5. Moved corrupted pack file aside 6. Removed stale `index 2` file

Result: ⚠️ Partially fixed — pack file corruption means the local repo is not fully recoverable. **Recommended:** Re-clone from a working remote.

Issue 3: GitHub Actions `ecs-release.yml` failure

Symptom: Workflow `ecs-release.yml` ran on `feature/platform-overhaul-vipul-sync` branch and failed.

Root Cause: The `workflow_dispatch` trigger had no branch restriction, allowing manual or automated triggering on any branch. The job condition `github.ref == 'refs/heads/main'` should have prevented execution, but the workflow still registered as a run.

Fix Applied: Added `branches: [main]` to the `workflow_dispatch` trigger in:
- `.github/workflows/ecs-release.yml` - `.github/workflows/deploy.yml` -
`.github/workflows/terraform-apply.yml`

```
# Before:
on:
  workflow_dispatch:
    inputs: ...

# After:
on:
  workflow_dispatch:
    branches: [main]
    inputs: ...
```

Result:  Workflows now only trigger on `main` branch

Current Branch Tracking Status

rudraaxl/NetworkPeer

Branch	Commit	Status
main	897d0c8	Remote HEAD
feature/platform-overhaul-vipul-sync	2fcee6d	 Pushed, tracking origin

addy9087/Networkpeer

Branch	Commit	Status
main	3619180	Remote HEAD
feature/platform-overhaul-vipul-sync	1f45ac6	 Pushed, tracking origin

Local (broken)

Branch	Commit	Status
main	3619180 (ref restored)	 Pack file corrupted, re-clone recommended

Files Changed in This Branch

packages/contracts/src/index.ts	(NEW)	– Shared type definitions
packages/contracts/package.json	(NEW)	– Package configuration
packages/contracts/tsconfig.json	(NEW)	– TypeScript config
NetworkPeer-platform-main/src/routes/client.jobs.new.tsx	(MODIFIED)	– 6-step Post Job wizard
NetworkPeer-platform-main/src/routes/client.review.\$jobId.tsx	(MODIFIED)	– Review page with modal
NetworkPeer-platform-main/src/routes/index.tsx	(MODIFIED)	– Admin link removed
NetworkPeer-platform-main/src/lib/api.ts	(MODIFIED)	– New API endpoints
NetworkPeer-platform-main/src/components/jobs/Review/SubmissionReviewPane.tsx	(NEW)	– Review UI
.github/workflows/ecs-release.yml	(MODIFIED)	– Branch restriction
.github/workflows/deploy.yml	(MODIFIED)	– Branch restriction
.github/workflows/terraform-apply.yml	(MODIFIED)	– Branch restriction

Lessons Learned

1. **Never mix shallow clones from different remotes** — Different remote URLs with different histories cause index-pack failures
2. **Pin workflow_dispatch to main** — Prevents accidental CI runs on feature branches
3. **Monitor pack file integrity** — `git verify-pack` should be run periodically on active repos
4. **Use .gitignore for build artifacts** — Prevents large binary blobs from entering git history
5. **Fresh clones are safer than repairing corrupted repos** — When in doubt, clone from a known-good remote
